Persona Identities, Inc.

Persona Identities, Inc. engaged Trail of Bits, Inc. (Trail of Bits), a cybersecurity research and development firm, to conduct a review of six codebases to validate a specific list of client-provided claims, primarily around data integrity and system connections.

A team of two consultants conducted the review from March 30 to April 10, 2026, for a total of three engineer-weeks of effort. With full access to source code, documentation, and a staging environment of the persona-web project, we performed static and dynamic validation, mostly focused on manual code review. We focused on finding any evidence that any of the claims are violated. We were given access to the GitHub repositories along with the full Git history of the codebases.

During the audit, Trail of Bits found no evidence of violation of the six given claims:

1. No connection between onyx.withpersona-gov.com and FIVECAST Onyx.
2. The openai-watchlistsdb.withpersona.com endpoint is a simple application that contains no biometric processing code, no PEP checks, and no proprietary databases. It performs only one check: standard AML attribute matching on name, birth date, country, and address, producing potential match results and metadata.
3. The maximum biometric data retention (as defined by GDPR) is 3 years.
4. No backdoor for law enforcement access.
5. No linking of facial biometrics to financial records or law enforcement databases.
6. The 269 checks are a configurable menu, not universally applied.

Note that it is impossible to verify their truthfulness in a strictly provable way. Actions like manually intervening in the production infrastructure or hiding functionality in dependencies could allow Persona to violate the claims without evidence being visible in the code. That said, having full access to the repositories with their history was a reassuring factor and allowed us to better evaluate the claims.

Sincerely,

Jim Miller
