July 28, 2026

Private Tech, Inc.

Private Tech, Inc. (Cape) engaged Trail of Bits, Inc. (Trail of Bits), a cybersecurity research and development firm, to conduct a review of 20 codebases to validate a specific list of client-provided claims, primarily around data retention and processing of call data records (CDR), which contain personally identifiable information (PII).

A team of two consultants conducted an initial review from April 27 to May 1, 2026, and a team of one consultant conducted a follow-up review from July 27 to July 28, 2026, for a total of two engineer-weeks and two engineer-days of effort. With access to the source code of in-scope components, as well as partial access to the AWS deployments of the system, we performed static and dynamic validation, mostly focused on manual code review. We focused on finding any evidence that could make the claims false.

We were given access to the GitHub repositories in scope, including the full git history of the codebases. Access to AWS was provisioned through Okta and the AWS Access Portal, similarly to how Cape employees access AWS resources in their day-to-day operations.

Cape's CDR pipelines reflect awareness of AWS retention limitations. Internal CDR retention is enforced by Lambdas that delete objects older than 24 hours every 10 minutes, rather than by S3 lifecycle rules, which provide no SLA on the timing of expiration. External CDR buckets use S3 lifecycle rules but compensate for the lack of SLA by using a 25-day expiration, shorter than the 30-day retention window claimed by Cape. Retention of aggregate usage information derived from CDR is enforced by both deletion Lambdas and S3 lifecycle rules, where applicable. EFS deletion errors and stale objects in the internal CDR buckets are monitored by Grafana alerts.

During the audit, Trail of Bits found no evidence of violation of the two given claims:

1. CDR files are being deleted within the retention policy.
2. Cape does not extract or retain data from CDRs about individual consumer customers, except daily totals. Daily totals are the number of calls, number of SMS, number of MMS, and amount of data a subscriber used in a day. This data is retained for no more than 60 days and then deleted.

Note that it is impossible to verify the truthfulness of these claims in a strictly provable way. Actions like manual intervention to the production infrastructure or hiding functionality in dependencies could allow Cape to violate the claims without evidence visible in the code. Having Cape give full access to the repositories with their history and issues is an additional reassuring factor.

Sincerely,
Jim Miller
